

Make Secure File Translation Simply Automatic

Protect the online flow of potentially sensitive information via email efficiently by investing in a tool that allows project-specific correspondence to automatically translate into the desired language after a simple drag-and-drop.

It's no secret. Translating certain documents like email files such as .PDF, .ZIP, etc. used to be a huge time commitment. Manual translation or reliance on insecure, free online tools both presented issues regarding information security and operational efficiency.

With SYSTRAN's S-Box, there are no files passed through a browser or external source. All files stay on a user's desktop for maximum risk reduction.

SYSTRAN's suite of products already allows for unparalleled security of translation on-premise or in the SYSTRAN cloud. However, unique files such as email like .msg and .eml require additional licensing to securely and efficiently translate.

Luckily, SYSTRAN makes it simple to install and configure this server add-on with the S-box. A team-oriented, drag-and-drop-enabled tool that allows for batch translations which means you no longer have to translate potentially sensitive email and attachment data painstakingly one-by-one.

SYSTRAN S-Box Features

Translate files conveniently by "dropping" them into a language-specific folder.

A set-it-and-forget-it approach to multilingual translation, an intuitive drag-and-drop feature allows any team member to input any number of supported files into a shared folder for automatic translation. Need to reference a translation at a later date? Just access the output folder for quick, accurate translations.

Provide support for files in different formats.

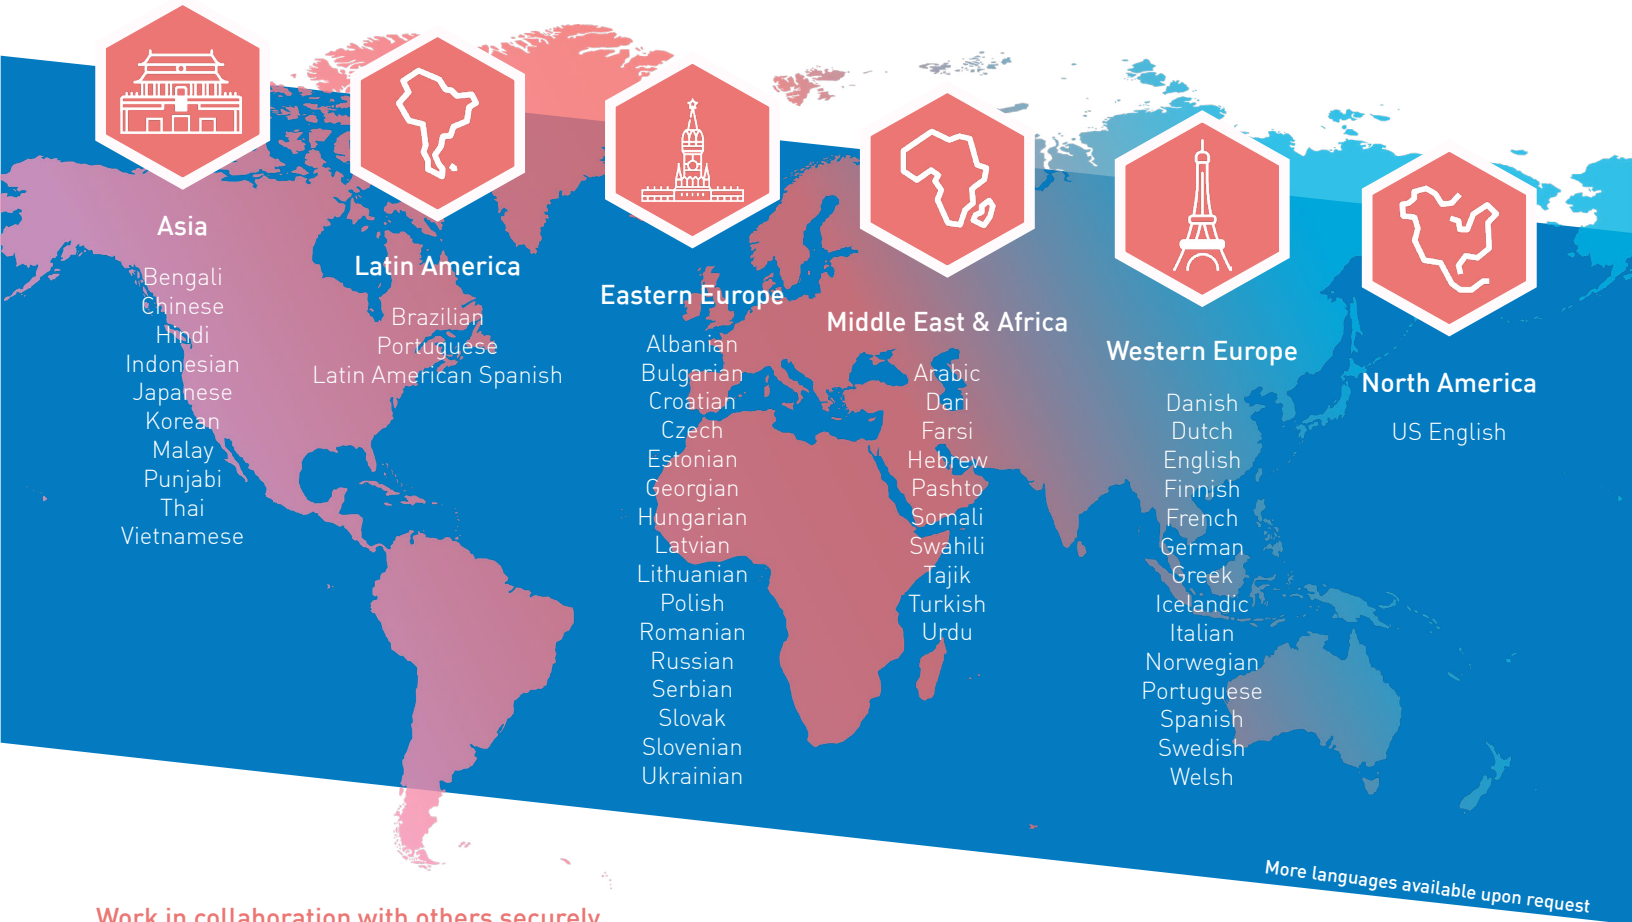

Never worry about the content of your emails being rendered unusable. The S-box accommodates most common file formats, including: .msg, .eml, .ZIP, and PDFs.

Configure to support one (1) or more language pairs, which identify the source language of the document and the desired translated language.

For global companies, email correspondence is constantly happening in many different languages. Just like the standard SYSTRAN servers, the S-box automatically detects language pairs and converts to your desired language.

Segment into separate project files.

Working on multiple secure and sensitive projects is simply the norm for the majority of SYSTRAN customers and users. The S-box allows for organized, project-based sorting of files so you can quickly access historical translated data for a particular project exactly when you need it.

Work in collaboration with others securely

Folders and files are truly collaborative and accessible to your entire team. No matter who submits a file for translation, any team member has visibility and can access any file entered into the team's project folders.

Execute faster PDF translation (2,000 characters/second)

Maintain SYSTRAN's Pure NMT speed advantages, so no matter how time-sensitive your translation needs, the system's capabilities will be up to the task.

Total process control

S-Box provides detailed log files crucial for auditing translation actions or possible problems that might occur, giving users a clear workflow for quick troubleshooting and complete oversight into their team's work.
